Regularized Identification of Dynamic Systems. Open Script. This example shows the benefits of regularization for identification of linear and nonlinear models. What is Regularization. When a dynamic system is identified using measured data, the parameter estimates are determined as where the criterion typically is a weighted quadratic norm of the prediction errors . An regularized criterion [Identification of Dynamic Systems | springerprofessional.de](#)

Precise dynamic models of processes are required for many applications, ranging from control engineering to the natural sciences and economics. Frequently, such precise models cannot be derived using theoretical considerations alone. Therefore, they must be determined experimentally. This book
